

Data Modelling

Database models defined within a process can be used jointly among multiple other processes. For example, a customer database designed for a customer management process can also be used independently in a separate help desk process. Where necessary, it is also possible to import data from external sources and treat it as a shared repository. This allows access to external data without using web services.

Database Modeller

Advanced database modeller for business entities.

XML Database

High performance and scalable native XML database support.

File Repository

Generic file repository for form attachments or document files.

Fulltext Indexing

Full text indexing for database entities with lucene engine.
