

## Cloud Backup Service on Cloud Volumes ONTAP

Cloud Backup Service is a Cloud Volumes ONTAP feature that generates automated backups of your unstructured data so that it can be rapidly restored whenever and wherever you need it.

### Eliminate the complexity of backing up data

Cloud Backup Service can be activated on Cloud Volumes ONTAP with just one click. It removes the need to design complex architectures, create custom scripts, and perform manual processes. View, manage and restore backups centrally from Cloud Manager. With just a few simple operations, you can automate your backup schedules and retention management. No need to be a backup expert. No need to integrate any external tools. No need to install anything.

### More flexibility at lower costs

Set your preferred backup schedule for an entire working environment or on the volume level. Once backed up, you can rapidly restore files, volumes or working environments. Backups can be restored back at the source environment or recovered in a new environment in any region. Data can also be restored to a new environment for analytics or testing without affecting the source data.

Data is transferred while keeping ONTAP's storage efficiencies such as deduplication, compaction and compression. Backups are forever incremental. The first backup is the baseline. All other backups only contain block-level changes. You only pay for what you protect.

### Keep your data safe and compliant

Cloud Backup Service protects your unstructured data from common human errors.

Backups are stored in object storage separate from the source but within the organization's cloud environment. You can meet business and regulatory compliance and still remain in full control of your backups. To address strict security requirements, data can even be backed-up on a separate cloud account from that of the source data.
