

The Canfigure Asset Management Module provides functions for the life-cycle management of fixed assets and inventory. Assets are not limited to IT equipment, and can represent any Plant, Property or Equipment. Capture of all maintenance related data as well as financials is provided with the flexibility to further extend the database schema. Built-in Tickets and Actions are used to control the install, maintenance, transfer and decommission of assets.

The inventory function supports tracking of items across multiple locations, and can be converted into assets or assigned to other entities such as people and projects.

Individual parts can be defined and linked as parent / child to show relationships to other items.

Configurable workflows can be tailored to your business.
