

Log Management

Centralized log data aggregation, detailed analysis,
and parsing to better secure your IT environment

Get log data from your infrastructure to speed up debugging, simplify and speed up troubleshooting procedures, keep up with mass information that helps determine the root cause.

Business Challenge

Each event in a network generates data. The recorded information accommodates in the form of logs produced by your OS, apps, clouds, servers, etc. As a rule, enterprises are prone to ignore the need to analyze produced data since it is a complex process that requires time and investment. However, the complexity of organizations' network environments makes it easy for digital threats to move through different parts of your infrastructure and destroy them gradually or entirely. The lack of log management stages means that one day you can find yourself open to digital attacks and let malicious activity remain undiscovered.

Solution

Logs are crucial to security visibility. InsightCat Logs helps advance your incident response and enhance corporate security by providing your IT with a log management solution. The regular log aggregation and the thresholds option allow you to analyze log data, assume system behavior and streamline alerting for your technical specialists in the case of critical issues. Specify the log data lifecycle rhythm to explore the log activity trends and filter them within the InsightCat platform based on your needs and preferences.

Benefits to Your Organization

Improved security

Reduce attack surface by improving response times, detecting errors or malicious activity, and monitoring every action in real-time.

Centralization

Don't waste time on searching, aggregating, storing, and analyzing log data from different sources. Do everything in one single platform that covers all log-oriented tasks.

Standardization

Follow the same format to standardize log data drawn from different systems. Standardize once to make it easier to carry out, maintain and generate insights about your IT infrastructure.

Key features

Data integrity

Get log data from all IT assets, collected in a single centralized log management solution. Insight Cat allows you to see all events that happened in your network, view them in the format you need, such as a table or JSON, and stay constantly informed about the system's performance with no hidden or undetected activities.

Secure to work remotely

Remote work generates logs on security access points, remote access, server logs, terminal services, and application logging — all of which are fed into an organization's security information. With a centralized Insight Cat solution, you'll be able to optimize your SIEM, increase your likelihood of meeting compliance requirements, and be able to log from more places with easy searchability, even when your employees work from different parts of the world.

Set up your thresholds

Define the thresholds of your system to avoid being overloaded with log information. Also, set up your own configurations for a more accurate understanding of which events need an immediate response and which can be postponed or ignored.

Automation

No need to review all of these logs manually each day. All logging information is passed to Insight Cat platform and is easily searchable, filterable, and easy to format to the organisation's needs. Log monitoring software takes care of these tasks by using rules to automate the review of these logs and point out events that might represent problems or threats.

Anytime, Anywhere

The Insight Cat, a log management solution, gives you complete control of the logging process from the initial search to defending against insider and outsider threats.

Best experience in your log monitoring

Synchronise the log management within the company. Keep your team involved and informed across all departments and positions. Insight Cat and its team of experts can ease this burden, leaving you able to focus on other pressing tasks.
