

A unique alternative to traditional OCR solutions

✓ High data accuracy

✓ All document types

✓ No manual post processing

	 NETFIRA Platform	Optical Character Recognition (OCR)
Basic Functions	Extracts, processes and exports data in any ERP system	Recognises texts from raster graphics (scan results, images or PDF files) and prepares them for electronic processing
Ways to Read and Process Data	1. Processes documents that have been scanned and read with OCR software 2. Reads out with own OCR software. Documents must have been scanned beforehand	After capturing the data, OCR incorporates the data into the downstream systems.
Accuracy	Almost 100% data accuracy	Very imprecise technology with imprecise reading of data, errors are often processed further
Post-Processing	Mostly not necessary at all	Always necessary, checking and correcting data needed
Supplier Connection	Netfira Onboarding App reads the first document with a high degree of accuracy. Following minor calibration afterwards, this document type is fully connected and all subsequent documents of this type are recognised and extracted.	Not necessary, documents from all suppliers can be processed directly
Document Types	All document types can be processed	Only some document types can be processed
Order Confirmations	AI-driven platform is specifically suited for processing unstructured data and order confirmations	Can be processed but with limitations and difficulties
Invoices	Can also read invoices	OCR systems are often part of e-invoicing systems
Number of Attributes	Reads all kinds of attributes and no restriction in number	Reads only a certain number of attributes
