# SYNCFIRST IQ

## SyncFirst IQ - The 30,000 Foot View:

Share Otherwise Inaccessible Data Sources

- · Tell SyncFirst IQ what information you want to capture
- Tell SyncFirst IQ which users will access each project
- **Transform and Analyze Your Data**
- SyncFirst IQ lets you filter, sort and summarize your data
- You can also visualize your data with tables, graphs and charts
- **Export Data to Other Applications**
- Data can be exported for use in databases, spreadsheets, etc.
- Automatically export data from standard forms and reports

# **About SyncFirst Standard**

SyncFirst Standard forms the core of our data mining system. SyncFirst Standard works with data from text files, PDF files, print spool files and ASCII data to produce structured tables for analysis, conversion to popular file formats and output to databases.

An organization's text files can often store massive amounts of important data. However, this information is typically structured in ways that only allow the data to be interpreted according to the original intent. For example, a report that shows total sales for each Part Number cannot be easily interpreted to reveal total sales by Customer Number. SyncFirst Standard makes this possible.

SyncFirst Standard's project system allows you to view reports, choose the information that's relevant and present it in a format that matches your specific requirements. Information from invoices, client records, monthly reports, payroll records and more can be extracted and output in minutes.

In the simplest terms, SyncFirst Standard allows you to use your unstructured input data and output it as structured data

# **Share Project Information**

SyncFirst IQ includes all of the features and functionality of SyncFirst Standard, but operates in a multi-user environment, allowing you to grant any user with access to your network full access to a shared project system, allowing multiple users to create and modify projects, export data and automatically generate any of the system's reports, tables, charts and graphs. Changes made by one user are immediately made available to all users, minimizing duplication of effort. Data exported by each user can also be shared with other users.

SyncFirst IQ also includes a set of functions that enable system administrators to manage users and their permissions to access each project.

# **Data Access Without Programming**

Projects contain detailed information about a report and its fields and sort levels. They can be repeatedly reused to extract data from standard reports.

The first step when creating a new project is to select the report that contains the data that you are interested in. Report data will usually come from simple text files, but may also be extracted from PDF or XML files. A project includes only a single report, but you can choose a new report for a given project at any time.

The project system makes it possible for all of this to be done with no programming or specialized technical skills

# **Flexible Installation and Deployment**

SyncFirst IQ can be installed and operated within an almost limitless variety of network environments. The system is designed to allow installation by users with limited technical training, while also supporting deployment by sophisticated users within more complex scenarios. Once the system is installed, administrators simply configure access to each shared folder and assign the necessary permissions to each user.
